

**SYLLABUS FOR  
MASTER OF COMPUTER APPLICATIONS**

**(Two years Program)**

**(Academic Session 2020-21)**

**DEPARTMENT OF COMPUTER SCIENCE**

**RAVENSHAW UNIVERSITY**

**CUTTACK, 753003**

**MCA 1<sup>st</sup> SEMESTER**

<b>Subject Code</b>	<b>Subject Name</b>	<b>Mid Term Marks</b>	<b>End Term Marks</b>	<b>Credits</b>
MCC - 1.1	Discrete Mathematical Structures	20	80	4
MCC - 1.2	Computer Organization and Architecture	20	80	4
MCC - 1.3	Probability & Statistics	20	80	4
MCC - 1.4	Data Structure	20	80	4
MCC - 1.5	Operating System	20(Lab)	80	4
MCL - 1.6	Data Structure Lab	25	50	2
MCL - 1.7	Object Oriented Programming C++ Lab	25	50	2
	<b>Total</b>	150+500=650		24

**MCA 2<sup>nd</sup> SEMESTER**

<b>Subject Code</b>	<b>Subject Name</b>	<b>Mid Term Marks</b>	<b>End Term Marks</b>	<b>Credits</b>
MCC - 2.1	Linear Algebra and Numerical Optimization	20	80	4
MCC - 2.2	Design and Analysis of Algorithms	20(Lab)	80	4
MCC - 2.3	Database Management Systems	20(Lab)	80	4
MCC - 2.4	Computer Network	20(Lab)	80	4
MCC - 2.5	Data Mining and Exploration	20(Lab)	80	4
MCL - 2.6	Java Programming Lab	25	50	2
MCL - 2.7	Python Programming Lab	25	50	2
	<b>Total</b>	150+500=650		24

**MCA 3<sup>rd</sup> SEMESTER**

<b>Subject Code</b>	<b>Subject Name</b>	<b>Mid Term Marks</b>	<b>End Term Marks</b>	<b>Credits</b>
MCC - 3.1	Advanced Java	20	80	4
MCC - 3.2	Machine Learning	20	80	4
MCC - 3.3	Theory of Computation	20	80	4
MCC - 3.4	Elective-1	20	80	4
MCC - 3.5	Elective-2	20	80	4
MCL - 3.6	Advanced Java with Lab	25	50	2
MCL - 3.7	Machine Learning Lab	25	50	2
	<b>Total</b>	150+500=650		24

## MCA 4<sup>th</sup> SEMESTER

Subject Code	Subject Name	Mid Term Marks	End Term Marks	Credit
MCC - 4.1	Software Engineering	20	80	4
MCC - 4.2	Elective-3	20	80	4
MCC - 4.3	Elective-4	20	80	4
MCC- 4.4	Project work	250 ( End-Term Project Evaluation (100) + Presentation (50) + Grand-Viva (100) )		12
	Total	300+250=550		24

**Note:** Elective-1 & Elective-2 are chosen from Group-A, and Elective-3 & Elective-4 are from Group-B.

**Total Marks: 650+650+650+550=2500**

**Total Credits: 24+24+24+24=96**

Group-A	1. Internet of Things
	2. Parallel and Distributed Computing
	3. Wireless Communication
	4. Information System & Data Management
	5. Ad Hoc Networks
	6. Soft Computing
	7. Computer Graphics
	8. Artificial Intelligence
	9. Network Science
	10. Computational Neuroscience
	11. Time Series Analysis and Forecasting
	12. Digital Signal Processing
	13. Software Defined Network
	14. Compiler Design
	15. Systems Modeling and Simulation
	16. Coding Theory and Maximum Entropy Principle
Group-B	1. Quantum Computing
	2. Cloud Computing
	3. Digital Image Processing
	4. Big Data Analytics
	5. Embedded System
	6. Cryptography and Network Security
	7. Natural Language Processing
	8. Wireless Sensor Network
	9. Green IT
	10. Deep Learning
	11. Computational Biology
	12. Advanced Software Engineering
	13. Computational Finance
	14. Software Evolution
	15. Block chain Technology
	16. Vehicular Networks
	17. Computer Vision

## VALUE ADDED COURSES

<b>Subject Code</b>	<b>Subject Name</b>	<b>End Term Marks</b>	<b>Credit</b>
VA-1	.Net Framework	50	2
VA-2	Android Programming	50	2

## ADD-ON COURSES

<b>Subject Code</b>	<b>Subject Name</b>	<b>End Term Marks</b>	<b>Credit</b>
AO-1	Internet Technology	50	2
AO-2	Cyber Security	50	2

**First Semester**  
**Discrete Mathematical Structures (MCC-1.1)**  
**Full marks–100 (Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

The objective of the course is:

- To introduce the concepts of mathematical logic and its real life application.
- To introduce the concepts of relations and its properties. To perform the operations associated with relations. To introduce generating functions and recurrence relations.
- To introduce basic concepts of graphs, diagraphs and trees.
- To introduce the concepts of Boolean algebra. To minimize a Boolean function.
- To introduce the concepts of algebraic structures, To introduce the concepts of Combinatorics.

**Course Outcomes:**

After successful completion of this course, students would be able to:

- Apply mathematical logic to solve logic related problems.
- Identify equivalence relations, partial order relations. To solve recurrence relations.
- Familiarize with the applications of graphs, trees and algorithms on minimal spanning tree, model and solve real-world problems using graphs and trees.
- Minimize Boolean function using K-map and other techniques.
- Familiarize with algebraic structures. Apply counting techniques to solve Combinatorics problems.

**Unit I**

Logic: Fundamentals of logic, Logical inferences, Methods of proof of an implication, contra-positive proofs, proof of necessity and sufficiency, First Order Logic and other methods of Proof, Rules of Inference for quantified Propositions, Mathematical induction.

**Unit II**

Relations and Diagraphs: Relations and Directed Graphs special Properties of Binary Relation, Equivalence Relations, Ordering Relations, Operations on Relations, Path sand Closures, Directed Graphs and Adjacency matrices. Introduction to recurrence relations and gene rating functions, recurrence relations (nth order recurrence relation with constant coefficients, Homogeneous recurrence relations, non-homogeneous recurrence relation)

**Unit III**

Graphs: Basic Concepts, Isomorphism and Sub graphs, Trees and their Properties, Spanning Trees, Directed Trees, Binary Trees, Planar Graphs, Euler's Formula, Multi Graphs and Euler Circuits, Hamiltonian Graphs. Graph coloring.

**Unit IV**

Boolean Algebra: Introduction to Boolean Algebra, Minimization of Boolean Functions.

Boolean Functions, Switching Mechanisms, Partial ordering, Posets, Lattices as Posets – Properties of lattices–Lattices as algebraic systems–Sub lattices–Direct product and homomorphism.

### **Unit V**

Algebraic structures, Binary Operations, Semi Groups, Groups, congruence relation and quotient structures. Free and cyclic monoids, permutation groups, substructures, normal subgroups, rings, integral domains, and fields. Basic counting techniques: inclusion and exclusion, pigeon-hole principle, permutation, combination, summations.

### **Books:**

### **Texts:**

1. Discrete Mathematics for Computer Scientists & Mathematics, J.Mott,A.Kandel, T.P. Baker PIII (1999)
2. Discrete Mathematical Structures for Computer Science, Bernard Kolman, RobertC. Busby, Saaron Ross, PIII (1999)

### **Reference:**

1. Kenneth H.Rosen,“Discrete Mathematics and its Applications”,Mc.GrawHill,2002.
2. CLLiu, Elements of Discrete Mathematics, Second Edition,Tata McGraw-Hill.

**Computer Organization and Architecture (MCC-1.2)**  
**Full marks–100 (Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

The primary objective of Computer Organization and Architecture is to understand the concept of digital and binary system. The representation of data and digital logic circuits used in the computer system, it describes the design principles of electronic logic gates and combinational logic circuits and their implementation.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to:

- Understand number systems, conversion, and Fixed- and Floating-point representation, rules of Boolean algebra.
- Understand Boolean algebra, Encoder, Decoder, Multiplexer, DE multiplexers, Registers and Counter.
- Determine the different types of addressing modes, types of memory.
- Compare inter processor communication and synchronization.
- Summarize pipeline and vector processing, input output devices.

**Unit I**

Information Representation: Number systems, Binary numbers, Sign Magnitude & 2's complement representation. Fixed and Floating point, IEEE-754 Single Precision format, IEEE-754 Double Precision format, Precision and range, BCD code, ASCII, and EBCDIC.

Digital Electronics: Boolean algebra, Logic gates, Truth tables, Combinational circuits, Karnaugh map, Flip flops, Sequential circuits.

**Unit II**

Combination RTL Components: Integrated circuits, Multiplexer, Demultiplexer, Decoder, Encoder, Registers, Shift Registers, Binary Counters, Memory Unit - RAM, ROM. Parity generators and checkers, Adder/Subtractor, Programmable Logic Devices- PLA, PAL, ROM. Sequential RTL components: Registers counters.

**Unit III**

Central Processing Unit: General Register Organization, Stack Organization, Reverse Polish Notation, Machine Language instructions, addressing modes, Instruction types, Instruction set selection, Instruction cycle and execution cycle. Fundamental of assembly language Programming using 8085 microprocessor, RISC vs CISC

**Unit IV**

Memory Organization: Memory Hierarchy, Main Memory, Auxiliary Memory, Associative Memory, Cache Memory, Virtual Memory, Memory Management Hardware.

Multiprocessors: Characteristics of Multiprocessors, Interconnection Structures, inter processor Arbitration, Inter processor communication and Synchronization, Cache Coherence.

## **Unit V**

Pipeline and Vector Processing: Parallel processing, Pipelining, Arithmetic Pipeline, Instruction pipeline, RISC Pipeline, Vector Processing, Array Processing.

Input-Output devices and characteristics, Input-output mechanism: Memory-mapped I/O, Programmed I/O, Interrupts, Direct Memory Access.

### **Books:**

### **Texts:**

1. J. L. Hennessy & D. A. Patterson – Computer Architecture – A Quantative approach  
2nd Edition –Mergan Kaufman Pub – 1996
2. V. C. Hammacher, Z. G. Vranesic, S. G. Zaky – Computer Organization McGraw Hill  
1996
3. Mano M, Computer System and Architecture (3rd Ed) (PHI)

### **Reference:**

1. K. Hwang – Advanced Computer Architecture, McGraw Hill, 1993
2. D. Sima, T. Fountation, P. Kacsak – Advanced Computer Architecture – A design  
space Approach, Addison Wesley, 1997

## Probability & Statistics (MCC-1.3)

Full marks–100 (Mid Semester: 20 Marks; End Semester: 80 Marks)

### Objectives:

The objective of the course is to introduce the basic principles, techniques and application of Probability and Statistics. The course is oriented towards conditional probability (Baye's Rule), expected value of random variable, the Central Limit Theorem, probability distributions, estimation of parameter, hypothesis testing, fundamentals of stochastic process.

### Course Outcomes:

After successful completion of this course, students would be able to:

- Understand concepts of probability, conditional probability, joint probability distribution, random variable and its distributions of function.
- Calculate expected value, variance of random variable.
- Obtain knowledge of various discrete and continuous probability distributions and their application in real life problem.
- Learn basic concept in different estimation techniques and hypothesis testing used in statistics. their application in real life problem.
- Understand fundamentals of stochastic process and its related terminologies, understand Markov chains and its application.

### UNIT-1

Introduction to probability, Probability of an event, Sample Space, Calculating Probabilities using simple events, counting rules, additive rule & multiplication rule, conditional probability Bayes' rule random variable, discrete and continuous probability distribution, Joint probability distribution. Random variable, Cumulative distribution function, probability mass function, Probability density function.

### UNIT-2

The Bernoulli Random Variable, Mathematical expectation, Expectation of Random Variables: The Discrete Case and the Continuous Case. Independent Random Variables. Covariance and Variance, Moment Generating Functions. Markov's and Chebyshev's Inequality, Central Limit Theorem.

### UNIT-3

Binomial & Multinomial, Hypo-geometric, Geometric, Poisson distribution, Uniform, Normal, Exponential Distribution, Weibull's Distribution, Chi-square distribution, Sampling Distribution: Sampling distribution of  $\chi^2$ , Student t-distribution, F-distribution.

**Note:** (Calculation of first moment (mean), second moment, and variance of probability mass functions, probability density functions, and distribution functions. Derivation of first moment(mean), second moment, and variance of probability mass functions, probability density functions, and distribution functions from moment generating functions)

### UNIT-4

Estimation of parameter: methods of estimation, Estimating the mean of a single sample,

Standard error, Prediction interval, Tolerance limits, Estimating the difference between means of two samples, estimating proportion and variance of a single sample, Estimating the difference between two proportions and variances of two samples, maximum likelihood estimation, Moment estimation.

Test of hypothesis: one and two tailed tests, test on a single mean when variance is known & variance is unknown. Test on two means, test on a single mean population and test on two populations. One and two sample tests for variance.  $\chi^2$  test for goodness of fit and test for independence.

#### **UNIT-5**

Stochastic processes: Discrete and continuous, Definition with examples, Markov chains, Chapman Kolmogorov equations, Classification of states, Limiting Probabilities, some applications: The gambler's Ruin problem.

Principle of various random variates generation, Monte-Carlo simulation: solving of Integrations using simulation techniques.

#### **Books:**

#### **Texts:**

1. Sheldon M. Ross, Introduction to Probability Models, Tenth Edition, Academic Press .
2. Kishor S Trivedi, Probability and Statistics with Reliability, Queuing, and Computer Science Applications, PHI Learning Pvt. Ltd.

#### **Reference:**

1. Sheldon M. Ross, Simulation, Fifth Edition, Academic Press

**Data Structure (MCC - 1.4)**  
**Full marks–100 (Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

- To understand the fundamentals of different data structure.
- To be able to learn design principles and concepts of algorithms.
- To have a mathematical foundation in analysis of algorithm.

**Course Outcomes:**

Upon Completing the Course, Students will be able to:

- Learn the basic types for data structure, implementation and application.
- Know the strength and weakness of different data structures.
- Use the appropriate data structure in context of solution of given problem.
- Develop programming skills which require solving given problem. Use different design technique for algorithm.

**Unit I**

Performance analysis: time complexity and space complexity of Algorithms, List ADTs (Singly, Doubly and Circular), Implementations and its various operations.

Array ADTs: one, two, and multi-dimensional array, row and column major order of matrices, Array ADT implementations and its various operations.

Stacks and Queues: ADTs, Implementations, and its various applications.

**Unit II**

Trees ADT, Binary tree, Terminologies and Memory representation, Binary Search tree, Expression tree, Binary Heap tree, Threaded binary tree and AVL tree.

Introduction to Red Black trees, multi-way search Trees, B Trees, Advanced Tree ADTs, and Tree Traversals.

**Unit III**

Priority Queue ADTs and its applications, Graphs: Terminologies, its various representations and applications, Directed Graphs and Undirected Graph, Graph Traversals: BFS, DFS, and its applications. Spanning Trees, Minimum-Cost spanning trees: Prim's and Kruskal's Algorithms, Single-Source Shortest Paths: The Bellman-Ford and Dijkstra's algorithm, All-Pairs Shortest Paths: The Floyd-Warshall Algorithm.

**Unit IV**

Sorting Techniques: Bubble Sort, Insertion Sort Selection Sort, Quick Sort, Heap Sort, Radix Sort, Merge Sort, Bucket Sort, and Counting Sort, Performance Analysis: Best, Average, and Worst time complexity and space complexity.

**Unit V**

Searching Techniques: Linear and Binary, Performance Analysis: Best, Average, and Worst time complexity and space complexity.

Hash table representation: hash functions, collision resolution, separate chaining, open addressing, linear probing: quadratic probing, double hashing, rehashing, Dynamic storage

Management, Garbage collection and Compaction.

**Books:**

**Texts:**

1. Debasis Samanta, Classic Data Structures, PHI, Second Edition, 2014.
2. Langsam, Augenstein and Tanenbaum, Data structures using C and C++, PHI, 2010.

**Reference:**

1. Mark Allen Weiss, Data Structures and Algorithm Analysis in C++, Pearson Education, 2002.
2. Aho Hopcroft Ullman, Data Structures and Algorithms, Pearson Education, 2002.
3. S.Sahni, Data structures, Algorithms and Applications in C++, University Press (India) , 2nd edition, 2008.
4. Michael, T.Goodrich, R.Tamassia and Mount, Data structures and Algorithms in C++, Wiley student edition, John Wiley and Sons, 2008.

## **Operating System (MCC-1.5)**

**Full marks –100(Mid Semester Lab:20 Marks; End Semester:80 Marks)**

### **Objectives:**

The primary objective of this course is to introduce operating system structure and its services along with its design and implementation. To become familiar with the concept of a process, memory management, storage system, I/O management and basics of security environment.

- To understand operating system, its structure, design and implementation and different services.
- To analyze the concept of process management, different scheduling algorithms and the basics of Inter process communication.
- Fundamentals of Threads and process synchronisation.
- Demonstration of critical section problems and overview of deadlock.
- To get knowledge about memory management strategies and virtual memory concept.
- To introduce File system its basic concepts and secondary storage structure.
- Design principle of security, user authentication and protection mechanism
- Introducing elementary Linux commands and shell programming.

### **Course Outcomes:**

Upon successful completion of this course, the student shall be able to:

- Fundamentals of operating system, types, system calls, system design and implementation and system structure.
- Concepts of process, operations, scheduling algorithms, fundamentals of threads.
- Overview of Process synchronization and Critical section problems
- The concept of deadlock along with the deadlock detection, prevention and avoidance.
- The strategies of memory management and various memory allocation techniques.
- The paging concept and different page replacement techniques. Concept of virtual memory management and its implementation.
- Implementing File and directory structure, disk structure and its management.
- Security environment, user authentication and the elementary Linux command and shell programming.

### **Unit I**

Introduction: What is an Operating System, Simple Batch Systems, Multiprogramming and Time-Sharing systems. Personal Computer Systems, Parallel Systems, Distributed Systems and Real time Systems, Operating system structures: OS Services, system calls, operating system structure, Process Management: Process concept, Process Scheduling, Operation on Processes, Cooperating Processes. Inter process communication. Threads, CPU Scheduling: Basic concepts, scheduling criteria, scheduling algorithms.

### **Unit II**

Process synchronization: Background, Critical section problem, Semaphore, Overview of classical synchronization problem, Monitors, Deadlocks: System model, Deadlock Characterization Methods for Handling Deadlocks, Deadlock Prevention, Deadlock avoidance, Deadlock Detection, Recovery from Deadlock.

### **Unit III**

Memory management: Background, address Binding, Logical versus Physical Address space, Overlays, contiguous Allocation, Paging, Segmentation, Segmentation with paging, Virtual Memory: Background, Demand paging, performance of Demand paging, Page, Replacement Algorithms, Allocation of frames, Thrashing.

### **Unit IV**

Filesystem: File concept, Access Methods, RAID, Directory structure & implementation, Allocation Method, Free space management, I/O systems: Overview, I/O Hardware, Application of I/O interface, Kernel I/O-subsystem Transforming I/O requests to Hardware Operations, Secondary storage Structure: Disk Structure, Disk Scheduling, Disk Management, Swap space Management, Disk Reliability.

### **Unit V**

Security Environment, Design Principles Of Security, User Authentication, Protection Mechanism: Protection Domain, Access Control List, Development of Unix/Linux, Role & Function of Kernel, System Calls, Elementary Linux command & Shell Programming, Directory Structure, System Administration, Case study: Linux, Windows Operating System.

### **Books:**

#### **Texts:**

1. Abraham Silberschatz and Peter Bear Galvin, "Operating System Concepts", Addison Wesley.
2. P. Blkeiahn Prasad. Moswen, SCITECH, "Operating Systems and System Programming", Milenkovic, "Operating Systems Concepts and Design", Tata Mcgraw hill

### **Reference:**

1. Andrew, S Tannenbaum, "Operating System", PHI.
2. Y.Kanetkar "UNIX Shell Programming.",BPB.
3. Deitel & Deitel, "Operating System", Pearsons

**Second Semester**  
**Linear Algebra and Numerical Optimization (MCC -2.1)**  
**Full marks–100(Mid Semester: 20 Marks; End Semester: 80Marks)**

**Objectives:**

The objective of the course is:

- To introduce Systems of Linear Equations and its related terminologies. To find out solution of Systems of Linear Equations.
- To familiarize with the concept of Eigen values, Eigen vectors, diagonalization of a matrix and their applications in different sectors.
- To introduce the basic principles, techniques, and application of linear programming problems.
- To introduce various types of one-dimensional Optimization Problem and their applications in different sectors.
- To introduce constrained and unconstrained optimization methods.

**Course Outcomes:**

After successful completion of this course, students would be able to:

- Solve a given system of linear equations. Understand the concepts of vector spaces, subspaces, bases, dimension and their properties.
- Compute the Eigen values and the Eigen vectors of a matrix.
- Solve linear programming problems with different approaches.
- Compute minimum value of a function in different one-dimensional optimization techniques.
- Compute minimum and maximum value of a function in LPP and NLPP.

**Unit 1**

Definition of a Vector Space, Linear Combinations, Linear Span, Convex Sets, Linear Independence and dependence, Basis, Dimension, Rank and Nullity of a matrix, Solution of Systems of Linear Equations.

**Unit 2**

Definition of Eigen Value and Eigen Vector, Characteristic Polynomial, Similar matrices, Diagonalization, Singular value decomposition and principal components, Positive and nonnegative definite matrices.

**Unit 3**

Graphical solution of linear programming problems, Simplex Method-Computational procedure, Artificial variable techniques, Two-phases simplex method, Big M-method, Concept of duality. Conversion of primal to dual and vice-versa, and its solution using both simplex and graphical methods. Dual simplex method, Revised simplex method.

#### **Unit 4**

**One dimensional Optimization:** One dimensional Optimization: Introduction, function comparison methods, polynomial interpolation, iterative methods.

**Function comparison methods:** Bisection Method, Fibonacci Method, Golden Section Search Method.

**Unconstrained Gradient based optimization methods:** Gradient based optimization methods: Method of Steepest Descent, Conjugate Gradient method, Newton type methods (Newton's method, Marquardt's method), Quasi-Newton method.

#### **Unit 5**

**Constrained Optimization Methods:** Lagrange multipliers, Kuhn-Tucker conditions, Convex Optimization, Penalty function techniques, methods of multiplier. Linearly constrained problems, Cutting plane method. Gradient projection method.

#### **Books:**

#### **Texts:**

1. Optimization: Theory and Practice by M.C. Joshi and K. Moudgalya, Narosa Publishing House, New Delhi, First Edition, 2004.
2. Kanti Swarup, P.K.Gupta & Man Mohan, Operation Research-2008, Sultan Chand & Sons Pub.
3. Gilbert Strang, Wellesey, Introduction to Linear Algebra, Fourth Edition, Cambridge Press/Cengage Learning, 2009

#### **Reference:**

1. David C.Lay, Linear Algebra and Its Applications, Person Education, Third Edition, 2014.
2. N.S.Kambo, Mathematical Programming Techniques, McGraw Hill, 2005.
3. Numerical Optimization, George Nocedal and Stephen J. Wright, Springer, 2nd Edition, 1999.
4. Linear and Nonlinear Programming, David G. Luenberger and Yinyu Ye, Fourth Edition, 2015.

## **Design and Analysis of Algorithms (MCC -2.2)**

**Full marks–100(Mid Semester Lab:20 Marks; End Semester: 80 Marks)**

### **Objectives:**

The objective of the course is to.

- Design and analysis of algorithms and find complexity on them.
- Understand the dynamic programming and greedy algorithms
- Analyze and implementation of Graph Algorithms
- Demonstrate NP-Completeness and Approximation Algorithms

### **Course Outcomes:**

Upon successful completion of this course, the student shall be able to:

- Identify the different design technique of algorithm.
- Analyze the different sorting algorithm based on time and space.
- Analyze the different approaches of designing algorithm like dynamic programming and greedy algorithms
- Discuss different graph algorithm.
- Solve NP-Completeness and Approximation Algorithms

### **Unit I**

Introduction to design and analysis of algorithms, Growth of functions, Recurrences, Solution of recurrences by Substitution, Recursion tree and Master method, Worst case analysis of Merge sort, Quick sort and Binary search.

Heap sort: Heaps, Building a heap, The Heapsort algorithm, Priority Queue, Lower bounds for sorting.

### **Unit II**

Dynamic Programming: Matrix-chain multiplication, Elements of dynamic programming, longest common subsequence.

Greedy Algorithms: An activity- selection problem, Elements of greedy strategy, Fractional knapsack problem, Huffman codes.

### **Unit III**

Data structures for Disjoint Sets: Disjoint set operations, Linked-list representation of disjoint sets, Disjoint-set forests.

Graph Algorithms: Elementary Graph Algorithms: Representations of graphs, Breadth-first search, Depth-first search, Minimum Spanning Trees: Kruskal and Prim's algorithms, Single-

Source Shortest Paths: The Bellman-Ford and Dijkstra's algorithm, All-Pairs Shortest Paths: The Floyd-Warshall Algorithm

#### **Unit IV**

Maximum Flow: Flow Networks, The Ford-Fulkerson method, Polynomials and the FFT: Representation of polynomials, The DFT and FFT, String Matching: The naïve string-matching algorithm, The Rabin-Karp algorithm.

#### **Unit V**

NP-Completeness: Polynomial time, Polynomial-time verification, NP-completeness and reducibility, NP-completeness proofs, NP-completeness problems, Approximation Algorithms: The vertex-cover problem, The travelling-salesman problem, The set-covering problem, The subset-sum problem.

#### **Books:**

#### **Texts:**

1. Introduction to Algorithms: T. H. Cormen, C. E. Leiserson, R. L. Rivest (PHI), Second Edition.
2. E. Horowitz, S. Sahani, S. Rajsekharan, "Fundamentals of Computer Algorithms", Second Edition, Universities Press, 2007

#### **Reference:**

1. Algorithm Design – Goodrich, Tamassia, Wiley India.
2. Algorithms By Sanjay Dasgupta, Umesh Vazirani – McGraw-Hill Education

**Database Management Systems (MCC-2.3)**  
**Full marks–100(Mid Semester Lab:20 Marks; End Semester:80 Marks)**

**Objectives:**

The objective of the course is to present an introduction to database management systems, with an emphasis on how to organize, maintain and retrieve - efficiently, and effectively - information from a DBMS. At the end of the course, the students will be able to:

- Understand the basic concepts and the applications of database systems.
- To design and build a simple database system and demonstrate competence with the fundamental tasks involved with modeling, designing, and implementing a DBMS.
- Master the basics of SQL and construct queries using SQL.
- Understand the relational database design principles.
- Understand Functional Dependency and Functional Decomposition.
- Familiar with the basic issues of transaction processing and concurrency control.
- Execute various advance SQL queries related to Transaction Processing & Locking using concept of Concurrency control.
- Understand query processing and techniques involved in query optimization.
- Understand the principles of storage structure and recovery management.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to understand:

- Apply the basic concepts of Database Systems and Applications.
- Use the basics of SQL and construct queries using SQL in database creation and interaction.
- Design a commercial relational database system (Oracle, MySQL) by writing SQL using the system.
- Analyze and Select storage and recovery techniques of database system.
- Will be able to design and implement properly structured databases that match the standards based under realistic constraints and conditions.
- Will be able to explain the principle of transaction management design.
- Will be able to work in a group on the design, and implementation of a database system project
- Will be able to describe and develop Relational Algebra and Relational Calculus queries

**Unit 1**

**Introduction:** Introduction to File and Database systems- History-Advantages, disadvantages- Data views – Database Languages – DBA – Database Architecture – Data Models -Attribute types — Keys -ER diagram–EER Diagram- Overview of Network and Hierarchical models.

**Unit 2**

**Relational Model:** The relational data model, Relational constraints, Relational calculus, the domain relational calculus, Relational algebra, ER and ERR to relational mapping.

**Query languages:** – SQL – Data definition – Queries in SQL – SQL: Basic queries, Complex queries, Insert delete and update statement in SQL, Views, Constraints and assertion, Updates.

### **Unit 3**

**Database Design:** Design Phases – Pitfalls in Design –Functional Dependence – Amstrong Axioms, cover, Minimal Cover, Normalization (1NF, 2NF, 3NF, BCNF, 4NF, 5NF). Lossless join decomposition, Dependency Preservation.

### **Unit 4**

**Transaction Management:** Transaction concept – state- Serializability – Recoverability- Concurrency Control –Locks- Two Phase locking – Deadlock handling– Time stamp ordering, Multiple Granularity, Multi Version Schemes, File Organization – Organization of Records in files–Indexing and Hashing, B+ Tree indexing.

### **Unit 5**

Query processing and Optimization: Basic algorithms for Query operations, Using heuristics, selectivity & cost estimates in query optimization, semantic query optimization

**Database Recovery:** Log based Recovery, shadow paging, Recovery with concurrent Transaction, Advanced Recovery Techniques

**Database System Architecture:** Centralized and Client Server Architecture, server system Architecture, Parallel systems, Distributed systems.

**Overview Data Mining-**Data ware housing

### **Books:**

### **Texts:**

1. Rameez Elmasri, Shamkant B. Navathe, Fundamentals of Database Sytems“,5thEd. Pearson Education, 2009.

### **Reference:**

1. Garcia-Molina, Hector. Database systems: the complete book. Pearson Education India, 2008.

## Computer Network (MCC – 2.4)

**Full marks–100(Mid Semester Lab:20 Marks; End Semester: 80 Marks)**

### Objectives:

The basic objective on the course is-

- To understand the concept of information exchange via communication media.
- To understand the different types of communication medium and transmission modes
- To understand the errors in communication and detect and correct error during information exchange over network.

### Course Outcomes:

Upon successful completion of this course, the student shall be able to:

- Describe Data Communication method and Networking Models, modes of transmission.
- Identify the types of Error and the approach for correction of error.
- Discuss ISDN, X.25 protocols and frame relay.
- Apply the routing algorithm to transfer data and to control traffic.
- Implement LAN using switch, bridge.

### Unit I

**Introduction:** Data Communication, Network Protocols and Standards, Point to Point and Multi Point line configuration, Network Topologies: Mesh, Star, Tree, Bus, Ring, Transmission Modes: Simplex, Half Duplex, Networks: LAN, MAN, WAN. The OSI Models: Function of Layers. TCP/IP Protocol Suit, Signals: Analog and Digital signals, Periodic and A periodic signal, Encoding and Modulating: Digital to Digital conversion. Unipolar. Polar Bipolar, Analog to Digital conversion AM, FM, PM

### Unit II

**Transmission of Digital data:** Parallel and Serial transmission. DTE/DCE interface, Modems, Guided and Unguided transmission media. Transmission impairment, Performance, **Multiplexing:** Frequency division, Wave division and Time division multiplexing, the Telephone system, Digital Subscriber Line (DSL), Error Detection and Correction: Types of Error, Redundancy Checks (VRC, LRC, CRC), Error Correction

### Unit III

**Data Link Control:** Line Discipline, Flow Control, Error Control, Data Link Protocol: Asynchronous and Synchronous Protocols, Character and Bit Oriented Protocols. Local Area Networks: IEEE 802 standards, Ethernet, Token Bus, Token Ring, FDDI Switching: Circuit Switching, Packet Switching, Message Switching

### Unit IV

Integrated Services Digital Network (ISDN), Services, History, Subscriber's access to ISDN, The ISDN layers, Broadband ISDN. X.25: X.25 Layers, Protocols related to X.25, Frame

Relay: Introduction, Frame Relay operation. Frame Relay layers, Congestion Control, Leaky bucket algorithm. Traffic control

### **Unit V**

Networking and Internetworking Devices: Repeaters, Bridges, Routers, Gateways, Routing Algorithms, TCP/IP Protocol Suite: Overview, Network Layer, Addressing Subnetting, Transport Layer, Application Layer: Client Server Model, BOOTP, DHCP, DNS, Telnet, FTP, SMTP, SNMP, HTTP, WWW.

## **Data Mining and Data Warehousing (MCC 2.5)**

**Full marks–100(Mid Semester Lab: 20; End Semester : 80)**

### **Objectives:**

The primary objective of this course is to introduce data mining and integration of data mining system with a data warehouse system. To become familiar with the concept of data pre-processing and data warehouse, OLAP technology for data mining.

- To understand Fundamentals of data mining and its different classification, Major issues in Data Mining and Data Preprocessing.
- Implementation of data warehouse and development of Data Cube Technology.
- Understanding mining Frequent Patterns, Associations and Correlations.
- To analyze different techniques of Classification and Prediction.
- The basics of Cluster Analysis.

### **Course Outcomes:**

Upon successful completion of this course, the student shall be able to:

- Fundamentals of data mining Functionalities, Classification, major issues in Data Mining.
- Need for Preprocessing the Data, Data Cleaning, Data Integration and Transformation, Data Reduction, Discretization .
- Multidimensional Data Model, Data Warehouse Architecture, Efficient Methods for Data Cube Computation.
- Mining Frequent Patterns, Associations and Correlations
- Issues Regarding Classification and Prediction
- Different Classification Methods
- Evaluating the accuracy of a Classifier or a Predictor
- A Categorization of Major Clustering Methods
- Clustering High-Dimensional Data and Outlier Analysis

### **UNIT-I**

Introduction: Fundamentals of data mining, Data Mining Functionalities, Classification of Data Mining systems, Data Mining Task Primitives, Integration of a Data Mining System with a Database or a Data Warehouse System, Major issues in Data Mining. Data Preprocessing: Need for Preprocessing the Data, Data Cleaning, Data Integration and Transformation, Data Reduction, Discretization and Concept Hierarchy Generation.

### **UNIT-II**

Data Warehouse and OLAP Technology for Data Mining: Data Warehouse, Multidimensional Data Model, Data Warehouse Architecture, Data Warehouse Implementation, Further Development of Data Cube Technology, From Data Warehousing to Data Mining Data Cube Computation and Data Generalization: Efficient Methods for Data Cube Computation, Further Development of Data Cube and OLAP Technology, Attribute-Oriented Induction.

### **UNIT-III**

Mining Frequent Patterns, Associations and Correlations: Basic Concepts, Efficient and Scalable Frequent Item set Mining Methods, Mining various kinds of Association Rules, From Association Mining to Correlation Analysis, Constraint-Based Association Mining.

### **UNIT-IV**

Classification and Prediction: Issues Regarding Classification and Prediction, Classification by Decision Tree Induction, Bayesian Classification, Rule-Based Classification, Classification by Back propagation, Support Vector Machines, Associative Classification, Lazy Learners, Other Classification Methods, Prediction, Accuracy and Error measures, Evaluating the accuracy of a Classifier or a Predictor, Ensemble Methods.

### **UNIT-V**

Cluster Analysis Introduction: Types of Data in Cluster Analysis, A Categorization of Major Clustering Methods, Partitioning Methods, Hierarchical Methods, Density-Based Methods, Grid-Based Methods, Model-Based Clustering Methods, Clustering High-Dimensional Data, Constraint-Based Cluster Analysis, Outlier Analysis.

#### **Books:**

#### **Texts:**

1. Data Mining– Concepts and Techniques–J.Han and M.Kamber, Morgan Kaufmann Publishers, Elsevier, 2<sup>nd</sup> Edition, 2006.

#### **References:**

2. Introduction to Data Mining–P.Tan, M.Steinbach and V.Kumar, Pearson Education, 2004.

**Third Semester**  
**Advanced Java (MCC- 3.1)**

**Full marks–100(Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

The objective of the course is to give an idea on advance java and its implementation in the programming perspective.

At the end of the course, the students will be able to:

- Understand basic knowledge advance java, web programming and concepts of UI programming.
- Database connectivity, JSP, MVC architecture.
- Servlet and RMI application and database program.
- Java bean, EJB, Ajax
- Spring and hibernate framework.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to do programming and Implementation on:

- Advance java, web programming and concepts of UI programming.
- Database connectivity, JSP, MVC architecture.
- Servlet and RMI application and database program.
- Java bean, EJB, Ajax.
- Spring and hibernate framework.

**Unit I**

Basic concept of network, types and features, browser, client, server, URL, webpage and website, Web Programming, HTML, basic structure, basic HTML commands, list, table, img, hyperlink, heading, marquee, form and components, frame, audio and video in HTML page, DHTML, program structure, java script, syntax structure, data types, tokens, operator, control structure, array, function, event and types, class and exception, process of writing and running program (HTML and DHTML), CSS, properties, CSS syntax, CSS selector, types of CSS, basics of XHTML and XML.

**Unit II**

JDBC, program on JDBC (insert, update, delete, select), JDBC use on application program, applet, AWT, swing (MVC), Enterprise Java Programming, JSP, features, syntax structure,

lifecycle ,dynamic webpage creation by jsp, Anatomy of JSP Page, Scripting Elements, implicit objects, directive elements, MVC in JSP, Session Tracking, jsp database access, JSP exceptions

### **Unit III**

SERVLET, features, jsp vs. servlet, servlet syntax structure, servlet life cycle, types of servlets, dynamic page creation by servlet, database access using servlet, session tracking, servlet API, servlet packages, creating cookies, RMI, features, RMI structure, Marshaling and Unmarshaling, RMI application and database program.

### **Unit IV**

JAVA BEAN, features, properties, types of java bean, program how to create java bean, EJB, features of EJB, life cycle of EJB, types of EJB, EJB architecture, program for creating EJB, AJAX, features, working of AJAX, AJAX request and response example, AJAX database connectivity.

### **Unit V**

Spring, spring framework, features, spring modules, spring example program, steps for creating spring application, Struts, features, creating struts application, basic features of JSF, FACELET, JSTL, JMS, hibernate framework

### **Books:**

#### **Texts:**

1. Ivan Bayross, part-1, web technologies, bpbpublication, newdelhi
2. Ivan Bayross, part-2, web technologies, bpbpublication, newdelhi
3. Steven Holzner, Java8 Programming Black Book, Dreamtech Press

### **References:**

1. Eric Jendrock, Java EE6 basic concept, Pearson
2. Java(j2EE) and Spring Framework, Ayan International
3. HTML & CSS: The Complete Reference, Fifth Edition. Thomas A. Powell

## **Machine Learning (MCC-3.2)**

**Full marks–100(Mid Semester:20 Marks; End Semester: 80 Marks)**

### **Objectives:**

- Enable students to realize the role of statistical frameworks for analysis, design and visualization of data.
- To make the students technically aware of state-of-the-art in the field of AI.
- To enable students to understand various intrinsic behavior of data and the logical framework behind the learning models.

### **Course Outcomes:**

- The course provides handy approach for fundamental model building and prediction.
- Computation of performance metrics of the developed models using different datasets.
- To enable students for incorporating their own customized learning frameworks from the above knowledge.

### **Unit I: Supervised Learning 1**

Overview of supervised learning, classification and regression problems, K-nearest neighborhood (KNN) classifier, Naïve Bayes Classifier,

Multiple linear regression, Shrinkage methods (Ridge regression, Lasso regression, elastic net), Logistic regression, Linear Discriminant Analysis, Feature subset selection.

### **Unit II: Model Assessment and Selection**

Loss function, Test and training error, Bias, Variance, and model complexity, Bias-variance trade-off, Cross-validation, Bootstrap methods, Performance of Classification algorithms (Confusion Matrix, Precision, Recall, and ROC Curve).

### **Unit III: Supervised Learning 2**

SVM for binary and multiclass classification, SVM for regression,

Regression and classification trees, ensemble learning and Random forest.

Boosting methods (AdaBoost, XG boost)

### **Unit IV: Unsupervised Learning**

Clustering (K-means, spectral clustering), Feature Extraction (Principal Component Analysis (PCA), kernel PCA, Independent Component Analysis (ICA)), Non-negative matrix factorization and collaborative filtering, Mixture of Gaussians and its applications to clustering, anomaly detection, and novelty detection.

### **Unit V: Neural networks**

Models of a neuron, Network architectures, Least-Mean-Square algorithm, Perceptron, Perceptron learning algorithm, Multilayer perceptrons, Back-Propagation algorithm (BPA), Heuristics for making the BPA perform better, accelerated convergence of BP learning, conjugate gradient method, quasi-newton methods. Self organizing maps.

**Lab implementation of the above methods and algorithms using Python.**

**Books:****Texts:**

## **Theory of Computation (MCC-3.3)**

**Full marks–100(Mid Semester: 20 Marks; End Semester: 80 Marks)**

### **Objectives:**

The primary objective of this course is to introduce the basic principles, techniques, and applications of automata theory concepts in real world problems.

- To understand the concept of machines: finite automata, pushdown automata, linear bounded automata, and Turing machines.
- To understand the formal languages and grammars: regular grammar and regular languages, context-free languages and context-free grammar; and introduction to context-sensitive language and context-free grammar, and unrestricted grammar and languages.
- To understand the relation between these formal languages, grammars, and machines.
- To understand the complexity or difficulty level of problems when solved using these machines.
- To understand the concept of algorithm.
- To compare the complexity of problems.

### **Course Outcomes:**

Upon successful completion of this course, the student shall be able to understand:

- able to design Finite Automata machines for given problems
- Describe the types of grammar and derivation tree
- able to analyze a given Finite Automata machine and find out its Language
- able to design Pushdown Automata machine for given CF language(s)
- able to generate the strings/sentences of a given context-free languages using its grammar
- able to design Turing machines for given any computational problem
- Develop a computational model using Turing machine for the given problem.
- Examine the complexity for P and NP completeness for the given problem.

### **Unit I**

Introduction to finite automata, Central concepts of automata theory, Informal picture of finite automata, Deterministic finite automata, non-deterministic finite automata, Application, Formal Language.

### **Unit II**

Regular expressions, Finite automata and Regular expressions, Applications of regular expressions, Algebraic laws of regular expressions, Pumping Lemma and its application for regular languages, Closure and Decision properties of regular languages.

### **Unit III**

Context-Free Grammars, Parsetrees, Ambiguity in Grammar & Languages, Pushdown automation. The language of PDA. Equivalence of PDA's and CFG's. Deterministic pushdown automata, Chomsky Normal form, The pumping Lemma for context free languages, Decision properties of CFL's.

### **Unit IV**

The Turing machine, Programming techniques for Turing machines, Extension to the basic

Turing machine, Restricted Turing machine, Turing machines and computers.

### **Unit V**

Non-Recursively enumerable languages, Undecidable problem that in recursively enumerable, Undecidable problem about Turing machines, Post's correspondence problem, other undecidable problems.

### **Books:**

### **Texts:**

1. Introduction to Automata Theory, Languages and Computation- J.Hopcroft, R.Motwani, J.D.Ullman– Pearson Education

### **References:**

4. Lewis Papadimitra: Theory of Computations, Prentice Hall of India, New Delhi.

**Elective-A07**  
**Computer Graphics (MCC -3.4)**

**Full marks–100(Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

The basic objective of the course is-

- To understand the concept of representation of information in graphical and pictorial way.
- Different types display of information by computer.
- Two dimension and three-dimension transformation and translation.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to:

- Understand the applications of computer graphics, display device and operating principle.
- Identify the different Line, circle and ellipse drawing Algorithms.
- Analyze the 2D transformation, clipping.
- Demonstrate 3D transformation and viewing.
- Classify the visible surface detection methods, Illuminating models.

**UNIT I**

A survey of computer graphics: Computer Aided Design, Presentation Graphics, Computer Art, Entertainment, Education Training, Visualization, Image Processing, Graphical User Interface. Overview of graphics system: Video Display Devices, Raster Scan Systems, Random Scan Systems, Input Devices, Hard-copy Devices, Graphics Software. Output primitives: Points and lines, DDA and Bresenham's Line Drawing Algorithm, Midpoint circle algorithm, Filled area primitives. Attributes of output primitives: Line attributes, Curve attributes, Colour and grayscale levels, Area-fill attributes, Character attributes, Bundled attributes.

**UNIT II**

Two dimensional geometric transformations: Basic Transformation (Translation, Rotation, Scaling), Matrix representation and homogenous coordination, Composite Transformation, Reflection, Shear. Two-dimensional viewing: The viewing Pipeline, Viewing Coordinate Reference frame, Window-to-viewport coordinate transformation. Clipping: Line Clipping (Cohen Sutherland Algorithm), Polygon clipping (Sutherland-Hodgemen Algorithm).

**UNIT III**

Three-dimensional object representation: Polygon Surfaces, Quadratic surfaces, Spline Representations, Beizer Curves and surfaces, B-Spline Curves, and surfaces.

**UNIT IV**

Three dimensional geometric and modeling transformations: Translation, Rotation, Scaling, Reflections, Shears, Composite Transformation. Three-dimensional viewing: Viewing pipeline, Viewing coordinates, Projections (Parallel and Perspective).

#### **UNIT V**

Visible-surface detection methods: Classification of visible-surface detection algorithms, back-face detection, Depth-Buffer method, A-Buffer method, Scan-line method, Depth-sorting method. Illumination Models: Basic illumination models, displaying light intensities, half tone Patterns and Dithering Technique, Polygon Rendering Methods, (Gouraud and phong shading)

#### **Books:**

#### **Texts:**

1. Computer Graphics C Version, by D. Heam and M. P. Baker, 2<sup>nd</sup> Edition, Pearson Education, 2002.

#### **References:**

**Elective -A08**  
**Artificial Intelligence (MCC -3.4)**

**Full marks–100(Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

The primary objective of this course is -

- To learn the basic concepts of AI principles and approaches.
- To develop the basic understanding of the building blocks of AI.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to:

- Demonstrate fundamental understanding of the history of artificial intelligence (AI) and its foundations.
- Apply basic principles of AI in solutions that require problem solving, inference, perception, knowledge representation, and learning.
- Demonstrate awareness and a fundamental understanding of various applications of AI techniques in intelligent agents, expert systems, artificial neural networks and other machine learning models.
- Demonstrate proficiency developing applications in an 'AI language', expert system shell, or data mining tool.
- Demonstrate proficiency in applying scientific method to models of machine learning.

**Unit I**

Introduction to AI, Application areas of AI, State-Space-Search: Production system design, Production system characteristic. Search Techniques Blind search: Depth first search, Breadth first search. Heuristic search Techniques: Hill Climbing, best first search, Branch and bound, A\*, AO\*.

**Unit II**

Game playing: Min-Max Search, Alpha-Beta Cutoff. Knowledge Logic: Skolemizing queries, Unification algorithm, Modes Ponens, Resolution.

**Unit III**

Structured knowledge representation: Semantic nets, Frames, Conceptual dependencies, Scripts.

**Unit IV**

Expert System: Expert System need & Justification, Rule based architecture, Nonproduction system architecture, Case studies of expert system: MYCIN, R1. Learning: Concept of learning, Types of learning, Genetic algorithm, Neural network.

**Unit V**

Natural language processing: Introduction syntactic processing, semantic analysis, discourse and pragmatic processing. Handling uncertainty: Probabilistic reasoning, Use of certainty

factor, Knowledge organization & management: Introduction, HAM.

**Books:**

**Texts:**

1. Rich & Knight (Chapters 1.1,2,3,5,9,10.1,10.2,12.1, 12.2, 12.3, 15.1-15.4, 17.1-17.6)
2. Dan W. Patterson (Chapters 4.1-4.4, 5.3, 11.1,11.4, 15.1-15.4)

**Reference:**

1. N.J. NilsonNorvig“Artificial Intelligence a Modern Approach”.

**Elective-A15**  
**Compiler Design (MCC-3.5)**

**Full marks–100(Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

- To provide a thorough understanding of the internals of Compiler Design.
- To explore the principles, algorithms, and data structures involved in the design and construction of compilers.
- Topics include context-free grammars, lexical analysis, parsing techniques, symbol tables, error recovery, code generation, and code optimization.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to understand:

- Realize basics of compiler design and apply for real time applications.
- Introduce different translation languages
- Understand the importance of code optimization
- Know about compiler generation tools and techniques
- Working of compiler and non-compiler applications
- Compiler for a simple programming language

**Unit I**

Introduction: Overview and phases of compilation. Non-deterministic and deterministic finite automata (NFA & DFA), Conversion of NFA to DFA, Classification of grammars, regular grammar, regular expressions and regular languages, Context free grammars, ambiguous grammar.

**Unit II**

Scanners: Top-down parsing, LL grammars, Bottom-up parsing, Operator precedence grammar, LR grammars, Comparison methods Error handling

**Unit III**

SLR parsers and construction of SLR parsing tables, LR (1) parsers and construction of LR (1) parsing tables, LALR parsers and construction of efficient LALR parsing tables, parsing using ambiguous grammars, Symbol table handling techniques, Organization for non-block and block structured languages

**Unit IV**

Syntax Directed Translation: Syntax directed definitions (SDD), inherited and synthesized attributes, dependency graphs, semantic rules, application of syntax directed translation. DAG for expressions, three address codes- quadruples and triples, types and declarations, translation of expressions, array references, type checking and conversions, translation of Boolean expressions and control flow statements, back patching, intermediate code generation for procedures. Run time storage administration, Static and Dynamic allocation.

**Unit V**

Intermediate forms of source program, Semantic analysis, and code generation. Code

optimization folding, peephole optimization, redundant sub-expression evaluation, redundant and un-reachable codes, Optimization with interactive loops. Basics of flow of control Optimization.

**Books:**

**Texts:**

1. A.V. Aho, R. Sethi & J.D. Ullman “Compilers Principles Techniques and Tools”  
Pearson Education

**Reference:**

1. Kenneth C. Loudon “Compiler Construction Principles & Practice “Cengage Learning  
Indian Edition

**Fourth Semester**  
**Software Engineering (MCC -4.1)**

**Full marks–100(Mid Semester :20 Marks; End Semester: 80 Marks)**

**Objectives:**

The primary objective of this course is to introduce Information System Development. To become familiar with process and life cycle models, Software design and Software Reliability and Quality Management.

- To understand Fundamentals of System Analysis and Design and concepts on process and life cycle models.
- Introduction to software specification, Software design coding and testing.
- Understanding S/W quality, Service-oriented Software Engineering and Aspect-oriented Software Development.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to understand:

- Fundamentals of Information System Development
- Understanding Evolution of Software Engineering and different life cycle models.
- Methods and strategies of Software design, coding and testing
- Software Reliability and Quality Management.
- ISO 9000: Modern Trends and Emerging Technologies.
- Agile software development, Extreme Programming (XP), Service-oriented and Aspect-oriented Software Development

**Unit I**

Introduction to Information System Development: Overview of System Analysis and Design, Categories of Information Systems, System development Strategies, Implementation and Evaluation, Tools for System development.

**Unit II**

Introduction to software Engineering: Basic concepts about software and program and Evolution of Software Engineering, Basic concepts on process and life cycle models, Models: Waterfall, Prototype, Evolutionary, Incremental, spiral, V, RADM etc. Requirement Analysis: Introduction to software specification, its needs and importance, formal specification methods, SRS attributes of good SRS and organization of SRS document.

**Unit III**

Software design: Methods and strategies, desirable design attributes, Concept of good design, Cohesion and coupling, Function-Oriented Software Design: structured system analysis and structured design, formal approach design, data flow oriented design, Software coding and testing: coding standard and guidelines, code review, software inspection, Testing: Unit, integration, system testing, black box and white box testing Incremental testing, formal proof of correctness, software matrix, Introduction to software verifications.

**Unit IV**

Software Reliability and Quality Management: S/W and H/W reliability, Reliability Matrices, Software engineering management: introduction to capability maturity model, quality assurance and software cost estimation (Delphi, COCOMO), Introduction to computer-aided, software engineering, Software reuse and maintenance.

#### **Unit V**

S/W quality, ISO 9000: Modern Trends and Emerging Technologies: Humphrey's Capability Maturity Model, CMMI (Capability Maturity Model Integration), Agile software development, Extreme Programming (XP), Security Engineering, Service-oriented Software Engineering, Aspect-oriented Software Development.

#### **Books:**

#### **Texts:**

1. Rajib Mall," Fundamentals of Software Engineering", PHI.
2. James A. Senn,"Analysis and Design of Information Systems",McGrawHill

#### **Reference:**

1. R.S.Pressman, "Software Engineering – A Practitioner's Approach", McGrawHill.
2. P.Jalote, "An Integrated Approach To Software Engineering", Narosa, NewDelhi.

## **Elective -B06**

### **Cryptography and Computer Security (MCC-4.2)**

**Full marks–100(Mid Semester: 20 Marks; End Semester: 80 Marks)**

#### **Objectives:**

The primary objective of this course is to introduce the basic principles, techniques, and applications of Cryptography, emphasizing on the teaching of these fundamentals, instead of providing an expertise of specific software tools or programming environments. It provides an opportunity to learn how to

- Secure your message Transmission
- In depth knowledge behind cryptographic approaches for solving real time problems
- To understand basics of Cryptography and Network Security
- To be able to secure a message over insecure channel by various means.
- To learn about how to maintain the Confidentiality, Integrity and Availability of a data.
- To understand various protocols for network security to protect against the threats in the networks.

#### **Course Outcomes:**

The student who successfully completes this course will be able to:

- Analyze and design classical encryption techniques and block ciphers and data encryption standard.
- Understand and analyze public-key cryptography, RSA and other public-key cryptosystems such as Diffie-Hellman Key Exchange, ElGamal Cryptosystem, etc.
- Understand key management and distribution schemes and design User Authentication
- Analyze and design hash and MAC algorithms, and digital signatures.
- Design network application security schemes, such as PGP, S/ MIME, IPSec, SSL, TLS, HTTPS, SSH, etc.
- Know about Intruders and Intruder Detection mechanisms, Types of Malicious software.

#### **Unit I**

Overview of Cryptography, Substitution and affine cipher, Poly alphabetic Cipher and their cryptanalysis, Perfect Security, Block Cipher, Data Encryption Standard (DES), 2DES, 3DES, Differential and linear Cryptanalysis, Block Cipher Design Principles, Block Cipher modes of operation, Advanced Encryption Standard.

#### **Unit II**

Principles of Public-Key Cryptosystems, The RSA Algorithm, Key Management, Diffie Hellman Key Exchange and Cryptanalysis, Authentication Functions, Message

Authentication Codes (MAC), Hash Functions, Security of Hash Functions and MAC, Secure Hash Algorithm, HMAC.

### **Unit III**

Discrete Logarithms, ElGamal System, Schnorr signature scheme, The ElGamal signature scheme, The digital signature algorithm, Provable secure signature schemes

### **Unit IV**

Elliptic curve over the reals, Elliptic curves modulo a prime, Properties of Elliptic curves Point compression and ECIES, Computing point multiples on Elliptic curves, Elliptic curve digital signature algorithm, ECElGamal Cryptosystem, ElGamal EC Digital signature scheme, Elliptic curve factorization, Elliptic curve primality test.

### **Unit V**

Network Security Practice: Kerberos, X.509 Authentication Service, Public Key Infrastructure, E-Mail Security (Pretty Good Privacy), IP Security (Architecture, Authentication Header, Encapsulation Security Payload, Combining Security Associations, Key Management), Web Security (Secure Sockets Layer and Transport Layer Security).

### **Books:**

#### **Texts:**

1. W.Stallings –Cryptography and Network Security Principles and Practice, Pearson Education.
2. Asia, 3rd Edition, 2000.

#### **Reference:**

3. D.Stinson -Cryptography: Theoryand Practice,CRC Press, 2006
4. BernardMenezes,” Network Security and Cryptography”,CengageLearning.
5. AtulKahate,“CryptographyandNetworkSecurity”,TMH

**Elective -A13**  
**Digital Image Processing**

**Full marks–100(Mid Semester: 20 Marks; End Semester:80 Marks)**

**Objectives:**

- To teach various conventional image processing concepts which will help to understand the recent advances and to implement real-time applications.

**Course Outcomes:**

- Student will able to get adequate knowledge to learn state-of-the-art in the field Computer Vision techniques to implement various real-time image processing applications.

**Unit I**

Digital image representation, image formation model, Sampling and quantization, Relationship between pixels, Fourier transforms, Discrete Fourier transforms, Properties of 2-D Fourier transforms, Discrete Cosine Transforms, Hadamard, Walsh, Hotelling transformation, 2D-Wavelet transformation, Wavelet packets.

**Unit II**

Image enhancement in the spatial methods, gray level transformations, Histogram processing, Histogram equalization, Histogram matching, Spatial filtering, Image restoration and degradation process, Noise models, Noise filtering models.

**Unit III**

Color Image processing: Color models, Converting RGB to HIS and vice-versa, Pseudo color processing, Full-color image processing, Color transformations, Smoothing and sharpening.

**Unit IV**

Image Compression: Fundamentals, Image compression model, Element of information theory, Error-free compression, Lossy compression standards.

**Unit V**

Image segmentation: Detection of discontinuities, Edge linking and boundary dictation, Thresholding, Region-oriented segmentation, the use of motion in segmentation.

**Books:**

**Texts:**

2. R. C. Gonzalez & R.E. Woods - Digital Image Processing, Pearson Education

**References:**

1. M.Sonka, V. Hlavac, R.Boyle, Image processing Analysis and Machine Vision Thomson Learning.
2. J.C. Russ, The Image Processing Handbook, (7/e), CRC, 2006.

**Elective – B02**  
**Cloud Computing**

**Full marks–100 (Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

The primary objective of this course is to introduce Cloud computing, Types and evolution of cloud computing. To become familiar with the concept Virtualization and Cloud security challenges.

- To understand Fundamentals of Cloud computing and Types of cloud services, Benefits and challenges of cloud computing.
- Understanding Service providers and Introduction to Map Reduce, GFS, HDFS, Hadoop.
- To analyze different collaborations on Calendars, Schedules and Task Management etc.
- The need for Virtualization and it's types
- The basics of Cloud security challenges and Standards for application developers, Standards for Messaging, Standards for Security.

**Course Outcomes:**

Upon successful completion of this course, the student shall be able to:

- Fundamentals of Cloud computing, Benefits and challenges of cloud computing, Usage scenarios and applications and Issues in cloud.
- Understanding Software as a Service, Platform as a Service, Infrastructure as a Service, Database as a Service, monitoring as a Service, Communication as a Service as well as Service providers.
- Collaborating on Calendars, Schedules and Task Management, Event Management, Contact Management, Project Management, Word Processing, Database.
- Collaborating via Web-based communication tools, Social Networks, Blogs and Wikis.
- Virtualization, Pro and Cons, Types of Virtualizations
- Virtual Machine Properties, Interpretation, and binary Translation, HLLVM, Hypervisors, Xen, KVM, VMWare, VirtualBox, Hyper-V
- Cloud security challenges, Common standards for application developers, Messaging and Security.

**UNIT I**

Cloud computing definition, Private, public and hybrid cloud, Types of cloud services: IaaS, PaaS, SaaS, Benefits and challenges of cloud computing, Evolution of cloud computing, Usage scenarios and applications, Business models around cloud, Major players in cloud computing, Issues in cloud, Eucalyptus, Nimbus, Open Nebula, Cloud Sim.

## **UNIT II**

Software as a Service, Platform as a Service, Infrastructure as a Service, Database as a Service, monitoring as a Service, Communication as a Service, Service providers: Google App Engine, Amazon EC2, Microsoft Azure, Sales force, Introduction to Map Reduce, GFS, HDFS, Hadoop Framework.

## **UNIT III**

Collaborating on Calendars, Schedules and Task Management, Collaborating Event Management, Contact Management, Project Management, Collaborating on Word Processing, Database: Storing and Sharing Files, collaborating via Web-based communication tools, Evaluating Web mail Service, collaborating via Social Networks, Collaborating via Blogs and Wikis.

## **UNIT IV**

Need for Virtualization, Pro and Cons of Virtualization, Types of Virtualizations, System VM, Process VM, Virtual Machine Monitor, Virtual Machine Properties, Interpretation, and binary Translation, HLLVM, Hypervisors, Xen, KVM, VMWare, VirtualBox, Hyper-V.

## **UNIT V**

Cloud security challenges, Software as a Service Security, Common Standards, The Open Cloud Consortium, The Distributed Management Task Force, Standards for application developers, Standards for Messaging, Standards for Security, End user access to cloud computing, Mobile Internet device and the cloud.

### **Books:**

### **Texts:**

1. Cloud Computing for Dummies, by J. Hurwitz, R. Bloor, M. Kanfman, and F. Haiper, Wiley India Edition, 2010 (Unit I).
2. Cloud Computing Implementation Management and Security by J. Rittinghouse and J. Ransome, CRC Press, 2010 (Unit II).

**Elective – B07**  
**Natural Language Processing**

**Full marks–100 (Mid Semester: 20 Marks; End Semester: 80 Marks)**

**Objectives:**

This course introduces the fundamental concepts and techniques of natural language processing (NLP). At the end of the course, the students will be able to:

- Gain an in-depth understanding of the computational properties of natural languages and the commonly used algorithms for processing linguistic information.
- Design NLP models and algorithms using both the traditional symbolic and the more recent statistical approaches.
- Grasp the significance of natural language processing in solving real-world problems.
- To map the appropriate processing technique to a problem and implement the technique.
- Comprehend the state-of-the-art advanced NLP research articles and present them to an audience.
- Make them understand the concepts of morphology, syntax, semantics and pragmatics of the language and that they are able to give the appropriate examples that will illustrate the above mentioned concepts.
- Describe the application based on natural language processing and to show the points of syntactic, semantic and pragmatic processing.
- Teach them to recognize the significance of pragmatics for natural language understanding.

**Course Outcomes:**

At the end of the course the student should be able to

- Understand approaches to syntax and semantics in NLP.
- Understand approaches to discourse, generation, dialogue and summarization within NLP.
- Understand current methods for statistical approaches to machine translation.
- Understand machine learning techniques used in NLP, including hidden Markov models and probabilistic context-free grammars, clustering and unsupervised methods, log-linear and discriminative models, and the EM algorithm as applied within NLP
- Distinguish among the various techniques, taking into account the assumptions, strengths, and weaknesses of each.
- Use appropriate descriptions, visualizations, and statistics to communicate the problems and their solutions.
- Analyze large volume text data generated from a range of real-world applications.

- Probabilistic model of defining language and techniques
- Applying Hidden Markov model and Speech Recognition
- Application of context free grammar and language parsing
- Differentiation of semantic and discourse in terms of NLP

## Unit I

Introduction and Basic Text Processing - tokens, sentences, paragraphs, Arg Max Computation, WSD: Word Net, Word net, Application in Query Expansion, Wiktionary, semantic relatedness, Measures of Word Net Similarity, Resnick's work on Word Net Similarity, Parsing Algorithms, Evidence for Deeper Structure, Top-Down Parsing Algorithms. Dirty Hands, Lexical resources, Word counts, Zipf's laws, Collocations, Concordances, Essential Information Theory, Entropy, Joint entropy and conditional entropy, Mutual information, The noisy channel model, Relative entropy or Kullback-Leibler divergence, The relation to language: Cross entropy, The entropy of English, Perplexity. Noun Structure; Top-Down Parsing Algorithms, Non-noun Structure and Parsing Algorithms, Probabilistic parsing; sequence labelling, PCFG, Probabilistic parsing, Probabilistic parsing: Training issues, Arguments and Adjuncts, Parts of Speech and Morphology, Nouns, pronouns, Words that a company nouns: Determiners and adjectives, Verbs, Other parts of speech, Phrase Structure, Phrase Dependency: Arguments and adjuncts, X' theory, Phrase structure ambiguity.

## Unit-II

Corpus-Based Work : Corpora, Software, Tokenization, Morphology ,Sentences, Marked-up Data Markup schemes, Grammatical tagging, Words: Collocations, Frequency, Mean and Variance, Hypothesis Testing, Hypothesis testing of differences, Pearson's chi-square test ,Likelihood ratios ,Mutual Information, The Notion of Collocation ,Statistical Inference: n - gram Models over Sparse Data: : Forming Equivalence Classes, Reliability vs. discrimination, n-gram models, Building-gram models, Statistical Estimators, Maximum Likelihood Estimation, Laplace's law, Lidstone's law, and the Jeffreys-Perkslaw, Held out estimation, Cross-validation (deleted estimation), Good-Turing estimation ,Combining Estimators, Simple linear interpolation, Katz's backing-off, General linear interpolation, Language models for Austen.

## Unit-III

Word Sense Disambiguation: Supervised and unsupervised learning, Pseudo words ,Upper and lower bound son performance, Supervised Disambiguation, Bayesian classification, An information-theoretic approach , Dictionary-Based Disambiguation ,Disambiguation based on sense definitions ,Thesaurus-based disambiguation, Disambiguation based on translations in a second-language corpus, One sense per discourse, one sense per collocation, Unsupervised Disambiguation, Lexical Acquisition: Evaluation Measures, Verb Subcategorization, Attachment Ambiguity, Hindle and Rooth, General remarks on PP attachment, Selection Preferences, Semantic, Vectors space measures, Probabilistic measures, The Role of

Lexical Acquisition in Statistical NLP , Markov Models, Hidden Markov Models, Finding the best state sequence, Implementation, Properties, and Variants, Multiple input observations , Part-of-Speech Tagging : 1 The Information Sources in Tagging, Markov model Taggers, The probabilistic model , The Viterbi algorithm, Hidden Markov Model Tagger, Applying to POS tagging, The effect of initialization on HMM training, Transformation-Based Learning of Tags ,learning algorithm, Tagging Accuracy and Uses of Taggers, Applications of tagging

#### **Unit-IV**

Probabilistic Context Free Grammars: Features of PCFGs, The Probability of a String, using inside probabilities, Using outside probabilities, Finding the most likely parse for a sentence, Training a PCFG, Probabilistic Parsing, Parsing for disambiguation, Tree banks, Parsing models vs. language models, Weakening the independence assumptions of PCFGs, Tree probabilities and derivational probabilities, Phrase structure grammars and dependency grammars, Equivalent models, Use of the geometric mean, Non-lexicalized grammars, Lexicalized models using derivational histories, Dependency-based models, Statistical Alignment and Machine Translation, Text Alignment , Aligning sentences and paragraphs, Length-based methods ,Offset alignment by signal processing techniques, Lexical methods of sentence alignment , Word Alignment, Statistical Machine Translation, Clustering: Hierarchical Clustering , Single-link and complete-link clustering , Group-average agglomerative clustering, An application: Improving a language model Top-down clustering, Non-Hierarchical Clustering, K-means ,EM algorithm, Information Retrieval: Some Background on Information Retrieval ,Common design features of IR systems, Evaluation measures, The probability ranking principle, The Vector Space Model, Vector similarity, Term weighting , Term Distribution Models , The Poisson distribution , The two-Poisson model, The K mixture, Inverse document frequency ,Residual inverse document frequency , Usage of term distribution models, Latent Semantic Indexing, Least-squares methods, Singular Value Decomposition, Latent Semantic Indexing in IR, Discourse Segmentation, Text Categorization, Decision Trees, Maximum Entropy Modeling, Generalized iterative scaling, Application to text categorization , k Nearest Neighbor Classification

#### **Unit-V**

Morphology, Graphical Models for Sequence Labelling in NLP, Forward Backward probability; Viterbi Algorithm, Phonology, Sentiment Analysis and Opinions on the Web, Machine Translation and MT Tools - GIZA++ and Moses. Text Entailment, POS Tagging, Phonology; ASR, Speech Synthesis, HMM and Viterbi, Precision, Recall, F-score, Map, Semantic Relations, UN, Towards Dependency Parsing., Universal Networking Language, Semantic Role Extraction, Baum Welch Algorithm, Entity Linking, Information Extraction, Back Propagation, Recurrent Neural network relevant to NLP, Language Generation, Applications– Sentiment Analysis, Spam Detection, Resume Mining, AInstein

#### **Books:**

#### **Texts:**

1. Daniel Jurafsky and James HMartin. Speech and Language Processing, 2e, Pearson

Education, 2009.

2. Allen, James, Natural Language Understanding, Second Edition, Benjamin/ Cumming, 1995.

3. Manning, Christopher and Heinrich, Schutze, Foundations of Statistical Natural Language Processing, MIT Press, 1999.
4. Shay Cohen, Bayesian Analysis in Natural Language Processing: Second Edition, Morgan & Claypool Publishers, 2019
5. Bernadette Sharp, Florence Sèdes, Wiesław Lubaszewski, Christopher D. Manning, Hinrich Schutze, Foundations of Statistical Natural Language Processing, Second Edition, 2000.

## **Elective – A01**

### **Internet of Things**

**Full marks – 100 (Mid Semester: 20; End Semester: 80)**

#### **Objectives:**

- Understand the definition and significance of the Internet of Things
- Discuss the architecture, operation, and business benefits of an IoT solution
- Examine the potential business opportunities that IoT can uncover
- Explore the relationship between IoT, cloud computing, and big data
- Identify how IoT differs from traditional data collection systems
- Students will be explored to the interconnection and integration of the physical world and the cyber space. They are also able to design & develop IOT Devices.

#### **Course Outcomes:**

- The students will be thorough about the technology behind the IoT and associated technologies
- The students will be able to use the IoT technologies in practical domains of society
- The students will be able to gain knowledge about the state of the art methodologies in IoT application domains.

#### **UNIT-I**

**INTRODUCTION& CONCEPTS:** Introduction to Internet of Things, Definitions and Characteristics of IoT, Physical Design of IoT, Things in IoT, IoT Protocols, Logical Design of IoT, IoT Functional Blocks, IoT Communication Models, IoT Communication APIs, IoT Enabling Technologies, Wireless Sensor Networks, Cloud Computing, Big Data Analytics, Communication Protocols, Embedded Systems, IoT levels and Development Templates, IoT Level-1, IoT Level-2, IoT Level-3, IoT Level-4, IoT Level-5, IoT Level-6.

Textbook 1:1.1 – 1.5

#### **UNIT-II**

IoT and M2M, Introduction, M2M, Difference between IoT and M2M, SDN and NFV for IoT, Software Defined Networking, Network Function Virtualization, IoT Platform Design Methodology, Introduction, IoT Design Methodology, Step1: Purpose and requirement specification, Step2: Process Specification, Step 3: Domain Model Specification, Step 4: Information Model Specification, Step 5: Service Specification, Step 6: IoT Level Specification, Step 7: Function View Specification, Step 8: Operational View Specification, Step 9: Device and Component Integration, Step 10: Application Development, IoT System Logical Design Using Python, Introduction, Installing Python, Python Data Types and Data Structures, Control Flow, Functions, Modules, Packages, File Handling, Date Time applications, Classes, Python Packages of Interest for IoT.

Textbooks 1:3.1-3.4, 5.1-5.4, 6.1-6.11

#### **UNIT-III**

IoT Physical Devices and End Points: What is and IoT Device, Exemplary Device Raspberry Pi, About the Board, Linux on Raspberry Pi, Raspberry pi interfaces, programming raspberry

pi with python, other IoT devices. IoT physical servers and cloud offerings: introduction to cloud storage models and communication Networks, wamp-autobahn for IoT, xively cloud for IoT, python web application frame work-django, designing a RESTful web API, amazon web services for IoT, SkyNetIoT messaging platforms.

Textbook 1: 7.1-7.7, 8.1-8.7

#### **UNIT-IV**

Data Analytics for IoT; Introduction ApacheHadoop, using HadoopMapReduce for Batch Data Analysis, Apache oozie, Apache Spark, Apache Storm, using Apache Storm for Real-time Data Analysis.

Textbook 1: 10.1 -10.8

#### **UNIT-V**

Ethics: Characterizing the IoT, Privacy, Control, Distributing Control and Crowd Sourcing, Environment, Physical Thing, Electronics, Internet Service, Solutions, Internet of Things as Part of Solution, Cautious Optimizing, The Open IoT definition.

Textbook 2: Chapter 11

#### **Books:**

#### **Texts:**

1. Internet Of Things-A Hands on Approach, by Arshdeep Bahga and Vijay Madiseti, University of Penn, <http://www.internet-of-things-book.com/>
2. Designing the Internet of Things, by Adrian McEwen and Hakim Cassimally, Wiley Publication.

#### **Reference:**

1. Internet of Things: Converging Technologies for Smart Environments and Integrated Ecosystems. By Ovidiu Vermesan and Peter Friess, River Publishers Series in Communication.

**Elective – A02**  
**PARALLEL & DISTRIBUTED COMPUTING**  
**Full marks – 100 (Mid Semester: 20; End Semester: 80)**

**Objective:**

- Learn about parallel and distributed computers.
- Write portable programs for parallel or distributed architectures using Message-Passing Interface (MPI) library
- Analytical modeling and performance of parallel programs.
- Analyze complex problems with shared memory programming with OpenMP

**Course Outcomes:**

At the end of this course student will be able to:

- Develop and apply knowledge of parallel and distributed computing techniques and methodologies.
- Apply design, development, and performance analysis of parallel and distributed applications.
- Use the application of fundamental Computer Science methods and algorithms in the development of parallel applications.
- Explain the design, testing, and performance analysis of a software system, and to be able to communicate that design to others.

**UNIT-I**

The need, scope and issues in Parallel Computing, The PRAM Model of Computation, Performance metrics, Amdhal's Law, Work – Time Formalism and Brent's Theorem, Basic PRAM Algorithm Design Techniques (Pointer Jumping, Divide and Conquer, Algorithm cascading)

**UNIT-II**

Further PRAM Algorithm design techniques (Partitioning, Euler tour, Symmetry breaking), Lower bounds for PRAM Algorithms, P- Completeness.

**UNIT-III**

Parallel Programming Platforms: (Control Structures & Communication Model, Physical Organisation, Communication Cost, Routing mechanism),

Communication Operations: (One-to-all and all-to-all broadcast and reduction, Personalized Communication, Scatter & Gather, Speed improvement), Programming using Message Passing Paradigm.

**UNIT-IV**

Principles of Parallel Algorithms design on distributed memory model: (Decomposition, Tasks and Interactions, Mapping), Methods for containing Interaction overheads, Parallel Algorithm model, Scalability of Parallel Systems, Application to Parallel Sorting and combinatorial search algorithms.

**UNIT-V**

Parallel Numerical Algorithms for Distributed Systems: Matrix Vector & Matrix – Matrix

Multiplication, Solution of Linear Systems (Iterative and Direct Methods. The conjugate gradient method), Fast Fourier Transform

**Books:**

**Texts:**

1. J. J'aj'a – An Introduction to Parallel Algorithms, Addison Wesley, 1992
2. V. Kumar, A. Gramma, A. Gupta, and G. Karypis – Introduction to Parallel Computing Design and Analysis of Algorithm – 2nd Edition, Pearson Education, 2003

**Reference:**

3. P. Pacheco – Parallel Programming with MPI, Morgan Kaufman, 1997.
4. M. J. Quin – Parallel Programming in C with MPI & OpenMP, TMH, 2003

**Elective – A06**  
**Soft Computing**

**Full marks – 100 (Mid Semester: 20; End Semester: 80)**

**Objectives:**

The primary objective of this course is to introduce the basic principles, techniques, and applications of soft computing techniques in real world problems.

- Artificial Intelligence, Various types of production systems, characteristics of production systems.
- Neural Networks, architecture, functions, and various algorithms involved.
- Fuzzy Logic, Various fuzzy systems, and their functions.
- Genetic algorithms, its applications, and advances.

**Learning Outcomes:**

At the end of the course the student should be able to

- Learn about soft computing techniques and their applications
- Analyze various neural network architectures and Understand perceptron and counter propagation networks.
- Analyze the genetic algorithms and their applications.
- Develop application on different soft computing techniques like Fuzzy, GA and Neural network
- Describe about hybrid soft computing techniques and its applications along with the fuzzy logic concepts and fuzzy system.
- Effectively use existing software tools to solve real problems using a soft computing approach

**Unit I**

(Artificial Neural Network) Introduction – Fundamental concept – Evolution of Neural Networks – Basic Models of Artificial Neural Networks – Important Terminologies of ANNs – McCulloch-Pitts Neuron – Linear Separability – Hebb Network. Supervised Learning Network: Perceptron Networks – Adaline – Multiple Adaptive Linear Neurons – Back-Propagation Network – Radial Basis Function Network.

**Unit II**

(Artificial Neural Network) Associative Memory Networks: Training Algorithms for Pattern Association – Auto associative Memory Network – Hetero associative Memory Network – Bidirectional Associative Memory – Hopfield Networks – Iterative Auto associative Memory Networks – Temporal Associative Memory Network. Unsupervised Learning Networks:

Fixed weight Competitive Nets – Kohonen Self-Organizing Feature Maps – Learning Vector Quantization – Counter propagation Networks – Adaptive Resonance Theory Networks – Special Networks.

### **Unit III**

(Fuzzy Set Theory) Introduction to Classical Sets and Fuzzy sets – Classical Relations and Fuzzy Relations – Tolerance and Equivalence Relations – Noninteractive Fuzzy sets – Membership Functions: Fuzzification – Methods of Membership Value Assignments – Defuzzification – Lambda-Cuts for Fuzzy sets and Fuzzy Relations – Defuzzification Methods.

### **Unit IV**

(Fuzzy Set Theory) Fuzzy Arithmetic and Fuzzy Measures: Fuzzy Rule Base and Approximate Reasoning: Truth values and Tables in Fuzzy logic – Fuzzy Propositions – Formation of Rules – Decomposition and Aggregation of rules – Fuzzy Reasoning – Fuzzy Inference Systems (FIS) – Fuzzy Decision Making – Fuzzy Logic Control Systems.

### **Unit V**

(Genetic Algorithm) Introduction – Basic Operators and Terminologies in GAs – Traditional Algorithm vs. Genetic Algorithm – Simple GA – General Genetic Algorithm – The Scheme Theorem – Classification of Genetic Algorithm – Holland Classifier Systems – Genetic Programming. Applications of Soft Computing: A Fusion Approach of Multispectral Images with SAR Image for Flood Area Analysis – Optimization of Travelling Salesman Problem using Genetic Algorithm Approach

### **Books:**

### **Texts:**

1. S.N. Sivanandan and S.N. Deepa, Principles of Soft Computing, Wiley India, 2007.
2. S. Rajasekaran and G.A.V.Pai, Neural Networks, Fuzzy Logic and Genetic Algorithms, PHI, 2003.

### **Reference:**

1. Timothy J.Ross, Fuzzy Logic with Engineering Applications, McGraw-Hill, 1997.
2. J.S.R.Jang, C.T.Sun and E.Mizutani, Neuro-Fuzzy and Soft Computing, PHI, Pearson Education, 2004.

**Elective – B05**  
**EMBEDDED SYSTEMS**

**Full marks – 100 (Mid Semester: 20; End Semester: 80)**

**Objectives:**

The course is designed to provide a concrete knowledge on Embedded systems. Students shall be able to know about different concepts and techniques for developing Embedded devices. It will also help the students to efficiently implement the programming on Microcontroller boards which can be used for doing specific tasks at Real-Time environment.

**Outcomes:**

- Identify different types of Embedded Devices.
- Understand concepts used during development of Embedded Devices.
- Understand the concepts of Device Drivers.
- Learn the programming concept for creating and implementing features on ARM board.
- Understand basic interfacing techniques to communicate Embedded Devices with Real world objects having Real-Time Output.

**UNIT I**

Introduction to embedded systems, classifications, processor in the system, microcontroller, introduction: 8051 architecture, features of 8051, basic assembly language programming concepts, instruction set, data transfer, logical operations, arithmetic operations, jump/call instructions, interrupt handler, addressing modes, an 8051 microcontroller design & testing

**UNIT II**

Interfacing of Keyboard, displays, ADC/DAC, stepper motor, dc motor; serial communication with PC using RS232, Serial Peripheral Interface (SPI), Inter-Integrated Circuit (I2C), serial communication with other microcontrollers/devices using I2C, SPI, RS232 and USB

**UNIT III**

Introduction to 16-bit micro-controllers, ATMEGA, PIC and ARM processors: General architecture and their limitations, clocking unit, Real Time Clock and Timers, Reset Circuitry and Watchdog Timer; development tools: ATMEL assembler and simulator, ATMEL AVR studio; robotic control applications

**UNIT IV**

Basic functions of PLC, advantages over microcontroller, basic architecture, register basics, timer functions, counter function, ladder diagram, overview of PLC systems, I/O modules, power supplies, isolators, programming PLC, Alarm signal generation for a process (e.g. heating, cooling or threshold of a process etc.), direct digital control (DDC) algorithm

**Unit V**

Operating system services, I/O subsystem, Network operating system, Real Time and embedded system, Need of well tested and debugged Real time operating system (RTOS), Introduction to C/ OS- II.

**Books:**

**Texts:**

1. Embedded Systems: Architecture, programming and Design, by Raj Kamal, TMH New Delhi.
2. 8051 Microcontroller, by Mazidi and Mazidi, Penram Publishers, New Delhi.
3. Microcontrollers: Theory and Applications, by Ajay V. Deshmukh, Tata McGraw-Hill Publishing Company Limited, New Delhi, 2005.
4. Embedded Real time system Programming, by Sriram V. Iyer and Pankaj Gupta, TMH.

**Reference Books:**

1. PIC Controllers, by Mike Predko, MGH.
2. Embedded System Design, by F. Vahid & T. Gargivis, John Wiley and Sons.
3. Embedded System Design: An Introduction to Process Tools and Techniques, A. S.
4. Berger, CMP Books.

**Elective – B08**  
**Wireless Sensor Networks**  
**Full marks – 100 (Mid Semester: 20; End Semester: 80)**

**Objectives:**

- To understand the basics of Ad-hoc & Sensor Networks.
- To learn various fundamental and emerging protocols of all layers.
- To study about the issues pertaining to major obstacles in establishment and efficient management of Ad-hoc and sensor networks.
- To understand the nature and applications of Ad-hoc and sensor networks.
- To understand various security practices and protocols of Ad-hoc and Sensor Networks.

**Course Outcomes:**

After completing the course, students will be able to:

- Explain the basic concepts of wireless sensor networks, sensing, and computing and communication tasks.
- Describe and explain radio standards and communication protocols adopted in wireless sensor networks.
- Describe and explain the hardware, software and communication for wireless sensor network nodes.
- Explain the architectures, features, and performance for wireless sensor network systems and platforms.
- Describe and analyze the specific requirements of applications in wireless sensor networks for energy efficiency, computing, storage and transmission.

**UNIT I**

Networked wireless sensor devices, Applications, Key design challenges.

Network deployment: Structured versus randomized deployment, Network topology, Connectivity, Connectivity using power control, Coverage metrics, Mobile deployment.

**UNIT II**

Localization: issues & approaches, Coarse-grained & Fine-grained node localization, Network-wide localization, Theoretical analysis of localization techniques.

Synchronization: Issues & Traditional approaches, Fine-grained clock synchronization, and Coarse-grained data synchronization.

**UNIT III**

Wireless characteristics: Basics, Wireless link quality, Radio energy considerations, SINR capture model for interference.

Medium-access and sleep scheduling: Traditional MAC protocols, Energy efficiency in MAC protocols, Asynchronous sleep techniques, Sleep-scheduled techniques, and Contention-free protocols.

Sleep-based topology control: Constructing topologies for connectivity, constructing topologies for coverage

#### **UNIT IV**

Routing: Metric-based approaches, Routing with diversity, Multi-path routing, Lifetime-maximizing energy-aware routing techniques, Geographic routing, Routing to mobile sinks.

Data-centric networking: Data-centric routing, Data-gathering with compression, Querying, Data-centric storage and retrieval, The database perspective on sensor networks.

#### **UNIT V**

Dependability issues: Security Challenges, Threat and attack models, Quality of Service provisioning, Clock Synchronization, Supporting fault tolerant operations. Introduction to Tiny OS, Nes C, Sensor Simulator.

#### **Books:**

#### **Texts:**

1. Wireless Sensor Networks: Technology, Protocols, and Applications: Kazem Sohraby, Daniel Minoli, Taieb Znati, Wiley Inter Science.
2. Wireless Sensor Networks: Architectures and Protocols: Edgar H. Callaway, Jr. Auerbach Publications, CRC Press.

#### **Reference:**

1. Wireless Sensor Networks: Edited by C.S Raghavendra, Krishna M, Sivalingam, Taieb Znati , Springer.

## **Elective – B12**

### **Advanced Software Engineering**

**Full Marks–100 (Mid Semester: 20 Marks; End Semester: 80 Marks)**

#### **Objectives:**

The primary objective of this course is to introduce Information System Development. To become familiar with process and life cycle models, Software design and Software Reliability and Quality Management.

- To understand Fundamentals of System Analysis and Design and concepts on process and life cycle models.
- Introduction to software specification, Software design coding and testing.
- Understanding S/W quality, Service-oriented Software Engineering and Aspect-oriented Software Development.

#### **Learning Outcomes:**

Upon successful completion of this course, the student shall be able to understand:

- Fundamentals of Information System Development
- Understanding Evolution of Software Engineering and different life cycle models.
- Methods and strategies of Software design, coding and testing
- Software Reliability and Quality Management.
- ISO 9000: Modern Trends and Emerging Technologies.
- Agile software development, Extreme Programming (XP), Service-oriented and Aspect-oriented Software Development

#### **Unit I**

Introduction to Information System Development: Overview of System Analysis and Design, Categories of Information Systems, System development Strategies, Implementation and Evaluation, Tools for System development

#### **Unit II**

Introduction to software Engineering : Basic concepts about software and program and Evolution of Software Engineering, Basic concepts on process and life cycle models, Models: Waterfall, Prototype, Evolutionary, Incremental, spiral, V, RAD etc., Requirement Analysis: Introduction to software specification, its needs and importance, formal specification methods, SRS: attributes of good SRS and organization of SRS document

#### **Unit III**

Software design: Methods and strategies, desirable design attributes, Concept of good design, Cohesion and coupling, Function-Oriented Software Design: structured system analysis and structured design, formal approach design, data flow oriented design, Software coding and testing: coding standard and guidelines, code review, software inspection, Testing: Unit, integration, system testing, black box and white box testing Incremental testing, formal proof of correctness, software matrix, Introduction to software verifications

#### **Unit IV**

Software Reliability and Quality Management: S/W and H/W reliability, Reliability Matrices, Software engineering management: introduction to capability maturity model, quality assurance and software cost estimation (Delphi, COCOMO), Introduction to computer-aided, software engineering, Software reuse and maintenance

#### **Unit V**

S/W quality, ISO 9000: Modern Trends and Emerging Technologies: Humphrey's Capability Maturity Model, CMMI (Capability Maturity Model Integration), Agile software development, Extreme Programming (XP), Security Engineering, Service-oriented Software Engineering, Aspect-oriented Software Development.

#### **Books:**

#### **Texts:**

1. Rajib Mall," Fundamentals of Software Engineering", PHI.
2. James A. Senn,"Analysis and Design of Information Systems",McGrawHill

#### **Reference:**

1. R.S.Pressman, "Software Engineering – A Practitioner's Approach", McGrawHill.
2. P.Jalote, "An Integrated Approach To Software Engineering", Narosa, NewDelhi.
3. G.Booch,"Object-Oriented Analysis and Design", Benjamin/Cumming Publishing Co.NewYork.

**Elective – B14**  
**Software Evolution**

**Full marks – 100 (Mid Semester: 20; End Semester: 80)**

**Objectives:**

The objective of the course is to study how software development and maintenance is taking place in an organization. Legacy information of software development.

At the end of the course, the students will be able to:

- Do models of software engineering and reengineering concepts.
- Understand Legacy information of software development and maintenance.
- Migration planning and its analysis.
- Re-structuring and reuse of software.
- Refactoring methods and Cognition Models for Program Understanding.

**Learning Outcomes:**

Upon successful completion of this course, the student shall be able to understand:

- How maintenance is done in an organization.
- software engineering and reengineering concepts.
- Legacy information of software development and maintenance.
- Migration planning and its analysis.
- Re-structuring and reuse of software.
- Refactoring methods and Cognition Models for Program Understanding.

**Unit I**

Introduction to Evolution and Maintenance, Classification of Software Maintenance: Intention-based, Activity-based, and Evidence-based. Categories of Maintenance Concepts: Product, Types, Organization Processes, People ware. Evolution of Software Systems: SPE Taxonomy, Laws of S/W Evolution, Empirical Studies, Evolution of FOSS Systems, Maintenance of COTS-based Systems.

Maintenance Models: Reuse-Oriented Model, Staged-Model for Closed Source Software (CSS) and Open Source Software (OSS), and Change Mini-Cycle Model, IEEE? EIA and ISO/IEC Maintenance Process, Software Configuration Management.

**Unit II**

Reengineering Concepts, A General Model of Software Reengineering, Reengineering Process, Code Reverse Engineering, Techniques used for Reverse Engineering, De-compilation Versus Reverse Engineering, Data Reverse Engineering, Reverse Engineering Tools.

Legacy Information Systems, Wrapping, Migration, Migration Planning, Migration Methods: Cold Turkey, Database First, Database Last, Composite Database, Chicken Little, Butterfly, Iterative.

### **Unit III**

Impact Analysis, Impact Analysis Process: Identifying the SIS, Analysis of Traceability Graph, Identifying the Candidate Impact Set, Dependency-Based Impact Analysis: Call Graph, Program Dependency Graph, Ripple Effect, Computing Ripple Effect, Change Propagation Model: Recall and Precision of Change Propagation Heuristics, Heuristics for Change Propagation, Empirical Studies.

### **Unit IV**

Re-factoring, Activities in a Re-factoring Process, Formalisms for Re-factoring: Assertions, Graph Transformation, Software Metrics, Examples of Re-factorings, Initial Work on Software Restructuring, Factors Influencing Software Structure, Classification of Restructuring Approaches, Restructuring Techniques. Reuse: Benefits of Reuse, Reuse Models, Factors Influencing Reuse, Success Factors of Reuse. Reuse Capability, Economic Models of Software Reuse: Cost Model of Gaffney and Durek, Cost Model of Gaffney and Cruickshank, Business Model of Poulin and Caruso. Domain Engineering, Application Engineering, Domain Engineering Approaches.

### **Unit V**

Program Comprehension, Goal of Code Cognition, Knowledge, Mental Model, Understanding Code, Cognition Models for Program Understanding: Letovsky Model, Shneiderman and Mayer Model, Brooks Model, Soloway, Adelson, and Ehrlich Model, Pennington Model, Integrated Meta-model, Protocol Analysis, Visualization for Comprehension.

### **Books:**

### **Texts:**

1. Software Evolution and Maintenance: A Practitioner's Approach, Priyadarshi (Piyu) Tripathy, and Kshirasagar (Sagar) Naik, Wiley, Hoboken, NJ, 2015.

### **Reference:**

1. Software Maintenance Concepts and Practice, Grubb P., and Takang A, 2e, World Scientific, 2003.

# Android Programming

## Objectives

- Android Application Development course is designed to quickly get you up to speed with writing apps for Android devices.
- The student will learn the basics of Android platform and get to understand the application lifecycle
- Android Developers design apps to be used on smartphones that utilize the Android operating system (OS).
- A number of apps can be designed for use on mobile devices, such as interactive games, media players, navigation software, and much more.

## Outcomes

- By the end of the course, student will be able to write simple GUI applications, use built-in widgets and components, work with the database to store data locally, and much more.
- Job Objective To secure a challenging and rewarding position as Android Developer with an established organization that can utilize my skills and experience.
- Designed and coded from specifications, analyzed, evaluated, tested and implemented complex software apps.

## Unit I

Introduction: History of Android, Introduction to Android Operating Systems, Android Development Tools, Android Architecture, Overview of object oriented programming using Java: OOPs Concepts: Inheritance, Polymorphism, Interfaces, Abstract class, Threads, Overloading and Overriding, Java Virtual Machine.

## Unit II

Development Tools: Installing and using Eclipse with ADT plug-in, Installing Virtual machine for Android sandwich/Jelly bean (Emulator), configuring the installed tools, creating an android project – Hello Word, run on emulator, Deploy it on USB-connected Android device. User Interface Architecture: Application context, intents, Activity life cycle, multiple screen sizes.

## Unit III

User Interface Design: Form widgets, Text Fields, Layouts, Button control, toggle buttons, Spinners (Combo boxes), Images, Menu, Dialog. Basics of Data Base: Introduction to SQ Lite

## Books:

## Texts:

1. Android application development for java programmers. By James C. Sheusi. Publisher: Cengage Learning, 2013.
2. James C. Sheusi, “Android application Development for Java Programmers”, Cengage Learning, 2013.

**Reference:**

1. M. Burton, & D. Felker, “Android Application Development for Dummies”, 2/e, Wiley India.

# **.NET FRAMEWORK**

## **Objectives**

The student will gain knowledge in the concepts of the .NET framework as a whole and the technologies that constitute the framework.

- The student will gain programming skills in C# both in basic and advanced levels.
- By building sample applications, the student will get experience and be ready for large-scale projects.

## **Outcomes**

- After completion of the course the student will be able to use the features of Dot Net Framework along with the features of C#
- .NET Framework is used to create and run software applications.
- .NET apps can run on many operating systems

## **Unit I**

Introducing C#: Understanding .NET, Overview of C#: Literals, Variables, Data Types, Operators, Expressions, Branching, Looping, Methods, Arrays: Strings, Structures, Enumerations.

OBJECT ORIENTED ASPECTS OF C# : Classes, Objects, Inheritance, Polymorphism, Interfaces, Operator Overloading, Delegates, Events, Errors and Exceptions.

## **Unit 2**

APPLICATION DEVELOPMENT ON .NET : Building Windows Applications, Accessing Data with ADO.NET.

## **Unit 3**

WEB BASED APPLICATION DEVELOPMENT ON .NET : Programming Web Applications with Web Forms, Programming Web Services.

## **Books:**

## **Texts:**

1. E. Balagurusamy, "Programming in C#", Tata McGraw-Hill, 2004. (Unit I, II)
2. J. Liberty, "Programming C#", 2nd ed., O'Reilly, 2002. (Unit III, IV, V)

**Reference:**

1. Herbert Schildt, "The Complete Reference: C#", Tata McGraw-Hill, 2004.
2. Robinson et al, "Professional C#", 2nd ed., Wrox Press, 2002.

# Internet Technology

## Objectives

- This course is intended to teach the basics involved in publishing content on the World Wide Web.
- This includes the ‘language of the Web’ – HTML, the fundamentals of how the Internet and the Web function, a basic understanding of graphic production with a specific stress on creating graphics for the Web, and a general grounding introduction to more advanced topics such as programming and scripting.
- This will also expose students to the basic tools and applications used in Web publishing.

## Outcomes

- After Studying that subject student would have capability to make own web site and host their own web site on internet.
- Also, students would have enough knowledge about what are the technologies used in internet.
- Build dynamic web pages using JavaScript (Client-side programming).

## Unit-1

Introduction to Networking: Brief idea about Server, Client, Protocol, Upload, Download, Hypertext, Hyperlink, Webpage, Website, WWW, Browser and Browsing.

HTML: HTML features, basic structure of an HTML document –creating an HTML document, mark up tags, heading, paragraphs, line breaks, working with text, lists, tables and frames, hyperlink, images and multimedia, forms and controls.

## Unit-2

Style sheets: Need for CSS, introduction to CSS, basic syntax and structure, CSS features, creating style sheet, CSS properties, CSS styling (background, text format, controlling fonts), Types of CSS, Types of CSS selector.

## Unit-3

JavaScript: Java Script features, Client side scripting, Simple JavaScript, How to develop JavaScript, simple JavaScript programs, variables, operators, datatypes, conditions, loops, array, functions, DHTML : Combining HTML, CSS and JavaScript, events and buttons, forms and validations.

## Reference Book:

1. Achyut Godbole, Atul Kahate "Web Technologies:TCP/IP,Web/Java Programming, and Cloud Computing",Third Edition,McGraw Hill Education.

2. Raj Kamal, "Internet and Web Technologies", Tata McGraw-Hill.
3. Web Technologies – Black Book – DreamTech Press
4. Matt Doyle, Beginning PHP 5.3 (wrox-Willey publishing)
5. John Duckett, Beginning HTML, XHTML, CSS and Java script.
6. HTML, XHTML and CSS Bible, 5ed, Willey India-Steven M. Schafer.

# Cyber security

## Objectives

- Exhibit knowledge to secure corrupted systems, protect personal data, and secure computer networks in an Organization.
- Understand principles of web security and to guarantee a secure network by monitoring and analyzing the nature of attacks through cyber/computer forensics software/tools.
- To prepare students with the technical knowledge and skills needed to protect and defend computer systems and networks.

## Outcomes

- Implement cyber security solutions and use of cyber security, information assurance, and cyber/computer forensics software/tools.
- Determine and analyze software vulnerabilities and security solutions to reduce the risk of exploitation. Implement continuous network monitoring and provide realtime security solutions.
- Explain the concepts of confidentiality, availability and integrity in Information Assurance, including physical, software, devices, policies and people. Analyze these factors in an existing system and design implementations.

## Unit 1

Cyber security fundamentals: Cyberspace, Cyber security, Importance of Cyber security, Hacker Types of malware: Worm, viruses, spyware, Trojans, Cyber security Breaches: Phishing, identity theft, harassment, cyber stalking, Types of Cyber attack: password attack, denial of service attack, passive attack, penetration testing.

## Unit 2

Prevention tips, Mobile protection, Social network security, Prevention software: firewalls, virtual private networks, anti-virus and anti-spyware, routine updates.

## Unit 3

Critical cyber threats: Critical cyber threats, cyber terrorism, Cyberwarefare, cyber espionage, Defense against hackers: cryptography, digital forensics, intrusion detection, and legal resource.
